# Supervision session notes

Oct 2, 2026 · @Rafa

This was not a session where she went through our slides one by one. It was more of a chat to tell us what to keep in mind at the point we are at in the project.

Here are my notes, put in order. The short version: we only need one scenario and one week, we should check which inputs really matter, and the next session is on Oct 27, 2026, online.

## What she told us

### Scope

- We only need **one scenario**, not all three.
- We only need **one week**.

### Inputs

- We can use the same inputs as the paper.
- We should not add temperature assumptions. They do not change much, so they are not worth the effort.

### Feature importance

- Once we have the model, we test which features matter and which do not. Some inputs may turn out to make no difference.
- We should show the feature importance in the slides.
- After that study, we change the model based on the results.

### Hyperparameters

- Use the methods we learned in class for hyperparameter optimization.
- The goal is to find a range of values to try, and then optimize inside that range.

### Accuracy

- We are not going to get 99%, and that is fine.
- We can calculate our accuracy value and explain why it is not higher.

### Level of work

- For the next session, a fast first-level piece of work is enough.

### Next session

- The next session is on Oct 27, 2026, online.

- Before that, we can meet her in person and show her our first model, so she can check it.

## Next steps

These come straight from her comments. Tick them off as we go.

- [ ] Choose the one scenario we will work with.
- [ ] Build a first quick model using the inputs from the paper.
- [ ] Run the feature importance study and add it to the slides.
- [ ] Pick the hyperparameter ranges, using the methods from class.
- [ ] Calculate our accuracy and be ready to explain why it is not higher.
- [ ] Settle the open points from the table above as a group.
- [ ] Ask her for a short in-person meeting to show the first model before 27 October.
- [ ] Have a fast first-level piece of work ready for the online session on 27 October.
